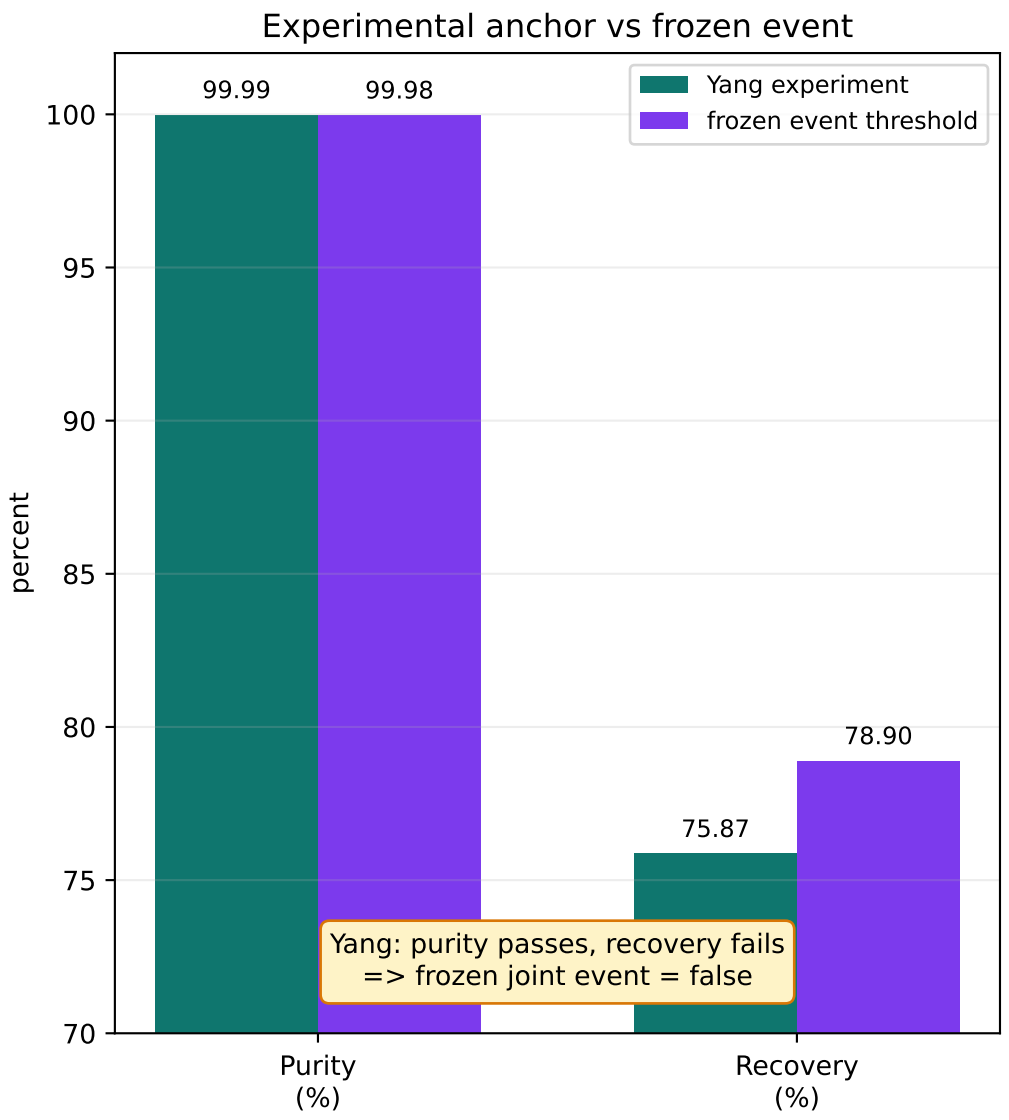
Public toPSAil/Yang evidence strengthens process validity without validating recycle 0.420



What the public H_2/CO evidence closes

✓ **Independent H2 separation chemistry**
H2/CO = 70/30 with zeolite 5A; external experiment and public model

✓ **Matched cyclic process structure**
2 beds, 6 steps, equalization, product tank and light-product purge

✓ **Experimental performance anchor**
99.99% H2 purity and 75.87% H2 recovery in Yang et al.

✓ **Published CSS/model calibration evidence**
valve/pressure/recovery calibration; 13/42/36/31-cycle CSS controls

✗ **Identical policy coordinate**
Yang P/F and product-tank purge are not the frozen product-gas recycle fraction

✗ **Frozen event and 0.420 selection reproduced**
Yang recovery is below 78.9%; repository distributes no result MAT files

Independent same-chemistry model + experiment anchor; same-policy selection gate remains open
